1 - F/R

The author gives an abstract form to a well-known necessary and sufficient condition for a function of sets to be the integral of a function  $g'(x) \in L^p$  where  $p > 1$ . He applies it to define what he terms the  $\rho$ th variation of a mapping  $f$  of a space  $X$  into a space  $Y$  subject to the following hypotheses: (i) There exists a non-negative measurable function  $g(x)$  such that the measure of  $f(E)$  is the integral of  $g$  on  $E$  whenever  $E$  is a measurable set on which  $f$  is one-one and that, further, (ii)  $X$  is a countable sum of measurable sets  $E_n = \sum E_i$ , where  $f$  is one-one in  $E_i$  ( $i > 0$ ) and where the measure of  $f(E_i)$  and the integral of  $g$  on  $E_i$  vanish. It is shown that the  $\rho$ th variation in question is then the integral of  $g^\rho$ . A change-of-variable formula is established on the further assumption that  $f^{-1}(A)$  is measurable whenever  $A$  is a measurable set in the space  $Y$ .

KUDRJAVCEV, L.D.

SUBJECT USSR/MATHEMATICS/Integral equations CARD 1/1 PG - 66  
AUTHOR KUDRJAVCEV L.D.  
TITLE On the properties of the harmonic mappings of plane domains.  
PERIODICAL Mat.Sbornik, n. Ser. 36, (1955) 201-208.  
reviewed 6/1956

The contents of this note was given without proof in Doklady Akad. Nauk 92, 469-471 (1953). The mapping  $u = u(x,y)$ ,  $v = v(x,y)$  of the plane domain  $G$  is called harmonic, if the functions  $u$  and  $v$  are harmonic in  $G$ . Let  $f(s) = u(s) + iv(s)$  be the one-to-one transformation of the boundary  $\gamma$  of the unite circle  $K$  onto a Jordan curve, the interior of which is denoted by  $\Gamma$ . It is supposed that  $u(s)$  and  $v(s)$  have the derivatives of the first order which satisfy the Hölder condition with  $\alpha < 1$ , and that there exists a function  $\tilde{u}(z)$  such that the Fourier series of  $\tilde{u}(z)$  is conjugate to the Fourier series of  $u$ . The author proves a necessary and sufficient condition for the existence of the harmonic transformation of  $\bar{K}$  onto  $\bar{\Gamma}$  which on  $\gamma$  is equal to  $f(s)$ . Several properties of the harmonic transformation are given.

INSTITUTION: Moscow

KUDRYAVTSEV, L.D.

SUBJECT      USSR/MATHEMATICS/Theory of functions      CARD 1/2      PG - 130  
AUTHOR      KUDRYAVTSEV L.D.  
TITLE      On differentiable mappings.  
PERIODICAL      Doklady Akad. Nauk 104, 12-14 (1955)  
reviewed 7/1956

The author considers differentiable mappings of a region of the euclidean  $n$ -dimensional space  $E^n$  and generalizes some results of the classical theory of functions. Theorem: If  $f$  is a continuously differentiable mapping of the region  $G$  and if the set of zeros of the functional determinant of  $f$  is isolated, then there exists no point sequence  $x_n \in G$  having a limit point in  $G$  and for which  $f(x_n) = f(x_m)$  for all  $n, m = 1, 2, \dots$ .  $f$  is called monotone (resp. compact) if the origin of every point is a continuum (resp. a compactum). A compact mapping  $f$  of the region  $G \subseteq E^n$  in  $E^m$  is called local monotone in the point  $y_0 \in f(G)$  if for every component  $f^{-1}(y_0) = X$  there exists a neighborhood  $\Gamma$  of this component  $X \subseteq \Gamma \subseteq G$  in which  $f$  is monotone. If  $f$  is local monotone in all points  $y \in f(G)$ , then it is called simple local monotone. The following generalization of Hadamard's theorem is valid: Let  $f$  be a local monotone differentiable mapping of a bounded simply connected region  $G \subseteq E^n$  onto an also simply connected region, where the boundary of the image is the image of the boundary. The set of the zeros

Doklady Akad. Nauk 104, 12-14 (1955)

CARD 2/2 PG - 130

of the functional determinant of this mapping shall have no inner points. Then  $f$  is a simple monotone mapping. The proof which is not carried out bases on the lemma: Let  $G$  be a simply connected, bounded region,  $f$  a compact, oriented, differentiable mapping, where the boundary of the image is the image of the boundary, and the set of zeros of the functional determinant possesses no inner points. Let be  $\psi(s)$ ,  $0 \leq s \leq 1$  a path in  $G$ . Let  $\phi(t, \theta)$  be a continuous deformation of the path  $f\psi(s)$ ,  $0 \leq t, 0 \leq \theta$ , where  $\phi(t, 0) = f\psi(t)$ ,  $\phi(0, \theta) = f\psi(0)$ ,  $\phi(1, \theta) = f\psi(1)$  and every point of the compact  $F = \{y = \phi(t, \theta), 0 \leq t, 0 \leq \theta\}$  is a point of local monotony.

Then for every  $\delta > 0$  there exists a path deformation such that  $\rho[f\psi(t, 1), \phi(t, 1)] < \delta$ ,  $0 \leq t \leq 1$ .

✓ Kudryavcev, L.D. On extension of functions and imbedding of classes of functions. Dokl Akad Nauk SSSR (N.S.) 107 (1956), 501-504. (Russian)

This note announces results which are only partly intelligible to the reviewer in the absence of some of the definitions. Thus, the author's first theorem concerns the extension, from an  $m$ -dimensional  $K$  manifold of class  $k$  to Euclidean  $n$ -space, of a function given on  $K$  together with its partial derivatives up to a certain order  $< k - (n-m)/p$  where  $p \geq 1$ . The original values of these partial derivatives are assumed to belong to classes  $H$ , depending on these various indices and on a further quantity  $M$ , classes which the author has neglected to define. The extension, whose existence is asserted, vanishes outside some neighborhood of  $K$  and satisfies various conditions which again depend on undefined symbols. L. C. Young.

SUBJECT USSR/MATHEMATICS/Differential equations CARD 1/1 PG - 376  
 AUTHOR KUDRJAVČEV L.D.  
 TITLE On the solution by aid of the variation method, of elliptic  
 equations which degenerate on the bound of the region.  
 PERIODICAL Doklady Akad. Nauk 108, 16-19 (1956)  
 reviewed 11/1956

The author considers the equation

$$L_6[u] = \sum_{i=1}^n \frac{\partial}{\partial x_i} (\delta \frac{\partial u}{\partial x_i}) = 0$$

which is an Euler equation for the functional

$$K_6[u] = \int \dots \int \delta \sum_{i=1}^n \left( \frac{\partial u}{\partial x_i} \right)^2 dx_1 \dots dx_n .$$

then denotes a certain subregion of the  $E^n$ . According as which  $\Gamma$  is meant, we have  $\delta = x_n^\alpha$  or  $\delta = \delta(x_1, \dots, x_n)$ , where in the latter case we have a positive, two times continuously differentiable function which satisfies still further conditions.

In the different regions  $\Gamma$  the author investigates the question of the existence of a solution. Without proof some existence- and uniqueness assertions are formulated.

PURPOSE: This book is intended for professional mathematicians and advanced graduate students of mathematics.

COVERAGE: The book is divided into three chapters. In Ch. I., the theory of best extensions (in the sense of the growth of derivatives as the boundary of a region is approached) of functions from the boundary of a region to the whole region is constructed. This problem of the best extension is solved here with accuracy up to an arbitrary  $\epsilon > 0$ . In Ch. II., a study is made

Card 1/4

## Direct and Inverse Embedding Theorems (Cont.)

SOV/3774

of weighted functions, for which partial derivatives exist, which are summable to a certain degree. Theorems on the embedding of these spaces in ordinary functional space are proven. A study is made of completeness, compactness, etc. Ch. III is devoted to a discussion of general variational principles of solving the first boundary value problem for conjugate elliptic equations of the second order. The proof of the existence and uniqueness theorems for the boundary value problems of elliptic differential equations which degenerate on the boundary of a region is also discussed. Most of the results in this book have been published without proof in previous articles by the author. The author thanks V. I. Kondrashov and P. I. Lizorkin for reading and correcting the manuscript. There are 50 references: 41 Soviet, 6 English, 2 French, and 1 Italian.

AUTHOR: Kudryavtsev, L. D.

TITLE: Variational method for unbounded domains

SOURCE: AN SSSR. Doklady\*, v. 157, no. 1, 1964, 45-48

TOPIC TAGS: variational calculus, elliptic equation, boundary problem, Euler equation

ABSTRACT: A variational method is considered for the solution of the first boundary problem for a self-adjoint elliptic equation in the case of an unbounded domain. Unlike in earlier studies of the method, no limitations are imposed on the summability of the boundary function, other than that the functional in question be finite, so as to ensure uniqueness and existence of the solution of the problem. Only the case of a half-space is considered, since it incorporates all the specific features of the variational method for unbounded do-

Card 1/4

ACCESSION NR: AP4042015

mains but is not subject to the difficulties involved with the structure of the domain boundary. The bilinear function is considered

$$A(u, v) = \int \left[ a'' \frac{\partial u}{\partial x_i} \frac{\partial v}{\partial x_i} + b' \left( \frac{\partial u}{\partial x_i} v + \frac{\partial v}{\partial x_i} u \right) + cuv \right] dE^n$$

where  $E^n$  -- n-dimensional Euclidean space of the points  $x$ , and the corresponding quadratic functional

$$A(u) = A(u, u)$$

along with the finite functional

$$K(u) = A(u) - 2(f, u)$$

The Euler equation of the functional  $K(u)$  is

$$L(u) + f = 0$$

with

Card 2/4

ACCESSION NR: AP4042015

$$L(u) = \frac{\partial}{\partial x_i} \left( a^{ij} \frac{\partial u}{\partial x_j} \right) + q u, \quad q = -c + \frac{\partial b}{\partial x_i}, \quad i, j = 1, 2, \dots, n.$$

If  $\varphi$  is a certain function defined on a hyperplane  $E^{n-1}$ , then several theorems are proved with respect to the aggregates of all functions  $u$  for which

$$D_p(u) < \infty, \quad u|_{E^{n-1}} = \varphi,$$

where

$$D_p(u) = \int \frac{1}{(1+p)^a} \sum_{i=1}^n \left( \frac{\partial u}{\partial x_i} \right)^p dE^n, \quad a > 0.$$

and the aggregates of the functions for which

$$A(u) < \infty, \quad u|_{E^{n-1}} = \varphi.$$

The results of this article are a reinforcement of the results reported by the author at the Soviet-American Symposium on Partial

TITLE: Imbedding theorem for a class of functions specified over an entire space or half-space. I

SOURCE: Matematicheskiy sbornik, v. 69, no. 4, 1966, 616-639

TOPIC TAGS: function analysis, boundary value problem, variational method

ABSTRACT: Imbedding theorems reflecting specific behavior of classes of functions specified over unbounded spaces have been investigated. The author discusses the cases encompassing an entire space as well as half spaces, derives the direct imbedding theorems, and establishes the properties of the resulting function and its limiting values when it is known that the function has derivatives of a given order which can be summed to a given degree (in general, in conjunction with some weight function). The theorems are subsequently generalized for functions of partial derivatives, and the paper also gives continuation theorems (inverse of imbedding theorems) for functions and systems of functions by means of functions of the respective classes. New classes of weight spaces  $W_{p,\alpha}^{(r)}(E^1 | \infty)$  and  $L_{p,\omega}^{(r)}(E^n | \infty)$  are also introduced,

Card 1/2

together with the appropriate proofs of all the basic theorems. The totality  
of new theorems extends the variational method for the solution of boundary  
value problems to the unbounded region, while basing it on the quite natural  
and, in a certain sense, minimum requirement that the energy integral be  
finite. Orig. art. has: 47 formulas. [JPRS: 36,482]

TITLE: Experience in Synthetic Latex Production at the Voronezh  
Synthetic Rubber Plant im. S.M. Kirov

PERIODICAL: Kauchuk i rezina, 1960, No. 11, pp. 33-35

TEXT: In the present article the authors have outlined their attempts to produce new latexes for the tire industry. The method for preparing the solutions and their resultant characteristics are given. The VNIISK and other scientific research institutes have developed the new formulation and the production procedures for the new type of latexes. In 1959 at the Voronezhskiy zavod SK im. S.M. Kirova (Voronezh SR Plant im. S.M. Kirov) a new shop was put into operation intended for the production of several types of commercial synthetic latexes including that of CKC-30 ШХП(SKS-30ShKhP) and СНД-1 (SKD-1), CKC-65ГП(SKS-65GP) (deep polymerization) for the production of emulsion dyes, CKC-50ПГ(SKS-50PG) ("foam hot rubber") for the production of foam rubber articles, etc. The shop is said to have begun production of 8 types of synthetic latexes on an in-

Experience in Synthetic Latex Production at the Voronezh Synthetic Rubber  
Plant im. S.M. Kirov

dustrial scale. The SKS-30ShKhP and SKD-1 latexes, the production methods  
of which are described, are said to have significantly increased the sta-  
bility of adhesion between rubber and cord and thus improved the quality  
of the casings. The solutions were prepared in the following manner: An  
aqueous-alkaline solution of the emulsifier (aqueous phase) was prepared  
in a cylindrical sealed apparatus (1) supplied with a mixer (Fig.1). De-  
salted water is pumped into the apparatus 1, then through the apparatus 2,  
through a measuring tank 3 a 25-30% solution of fatty acid soap is poured  
and through a measuring tank 4 a 32-37% solution of leuconal. An ammonium  
solution enters the apparatus 1 through a measuring tank 5. After measur-  
ing out all the components water is added to the final level and sodium  
sulfite is also added. In order to remove the iron salts and other ad-  
mixtures the ready aqueous phase is left to stand for several hours. The  
soap solution is prepared in apparatus 2. Desalted water is pumped into  
the apparatus and alkali is added. The alkaline solution is heated to  
60-70°C, after which fatty acids are added according to calculation. A

2-5% emulsion of cumene hydroperoxide in a soap solution, prepared in apparatus 8, is used as the initiating agent of the polymerization process. The activator of the process is prepared in apparatus 10, where desalinated water is pumped and hydroquinone and sodium sulfite are added. Trilon B is also added, which forms a complex compound with iron salts. The regulator of the polymerization process is diperoxide or bisethylxanthogenate. In order to simplify the dosaging, the regulator in apparatus 9 is first dissolved in styrene. The thin suspension of the stabilizer (Neozone D) is obtained on a colloidal mill 13, where a raw suspension of Neozone D enters from apparatus 12. From the capacity holder 14 serving as the collector the suspension is pumped off by a pump into the measuring tank 16. The polymerization is conducted in the polymerizer 24 with a capacity of 12 m<sup>3</sup> supplied with a mixer, from which first the oxygen is removed prior to the loading. The aqueous phase is poured from the measuring tank 17, the activator solution enters from the measuring tank 11. After the activator from the measuring tank 18 is added, styrene is then also

Plant im. S.M. Kirov

added and from the measuring tank 19 divinyl is introduced. The initiator is measured from the measuring tank 20, using a measuring plunger pump 21. The loading of the components is carried out at 10-12°C. The reacting mixture in the polymerizer is heated to 20<sup>±</sup>20°C. This temperature is kept up to the end of the process. Removal of the heat formed during the polymerization process is accomplished by supplying cold water to the container and a brine solution to the spiral tube of the apparatus. At a depth of polymerization equalling 15, 30 and 45% the regulator solution is measured out in equal amounts from the measuring tank 22 by means of a pump 23. The polymerization process is completed when the depth reaches 60% corresponding to a content of 27-28% dry substance in the latex. The polymerization duration is 60-20 hours. The latex is cooled to 10°C and poured into a cistern 25, previously treated with a solution of complex monophenols. The non-degasified latex contains a large number of free monomers which are distilled off on a two stage distilling column 28. By

Plant im. S.M. Kirov

means of a pump 27 the latex is fed to the top part of the first stage of the column 28 and from there it is pumped over to the top part of the second stage. From the vat of the column the degasified latex passes through a hydro-lock 30 and is poured down into the capacity holder 31, from where it is pumped with a pump to a storing house. Live steam is fed to the top part of the 2nd stage. From the vat of the 2nd stage aqueous vapor and monomer vapors enter the 1st stage, from where they pass to condensation. The monomer distillation from the latex is done under a vacuum of 600-650 mm Hg created by a water-ring vacuum pump of the PMK-3 (RMK-3) type. The commercial SKS-30ShKhP latex is said to satisfy the following technical conditions: dry substance content in the latex, %.... no less than 24, Neozone D content, %.... 1.2-2, pH... 9.5-11, dissolution threshold....1:100, gelatinization temperature, °C.. not below +5, hardness of the copolymer, according to Defoe, g....1,500-4,000. The shortcoming of the latex is a lowered stability compared to SKS-30 latex. The measuring out of the initiator and the regulator ✓

Card 5/9

S/138/60/000/011/008/010

Plant im.S.M. Kirov

directly carried out from the measuring tanks by means of leveling lines causes the foam of the latex to clog the measuring tanks leading to a disruption of the measuring accuracy. In order to eliminate these shortcomings it was suggested to establish measuring pumps of the plunger type. One of the main aspects in perfecting the recommended flow-sheet is the change-over from the batch-type to the continuous method. The latter would improve the production standard and quality and to increase the output. Another shortcoming is said to be the presence of "dead levels" in the cisterns of the non-degasified and degasified latex. In changing from one type of latex to another a great deal of work is involved, in order to free the cisterns of latex remains, leading to irreversible loss of the finished product. In discussing the production method of the SKD-1 latex, it is said that the polymerization is carried out in an acidic medium formed by an organic unsaturated acid. The principal scheme is the same as for that of the SKS-30ShKhP latex. A

solution of Nekal is dissolved and kept for 24 hours in order to eliminate the iron salts. A 5%-emulsion of hydroperoxide in Nekal is used as the initiator. At a depth of the polymerization of 53-56% the latex is poured into the cistern. The SKD-1 latex is said to have the following characteristics: dry substance content, %..... no lower than 18, Neozone D, % ..... 1-2 of the dry substance, pH.....8.5-9.0, threshold of dissolution ..... 1:100, gelatinization temperature, °C..... not below 5, copolymer hardness, according to Defoe, g.....1,500-4,000. There is one flow-sheet.

PURPOSE: This collection of articles is intended for scientific  
workers and technical personnel of research institutes, plants,  
and schools of higher technical education.

SCOPE: The collection contains papers presented at a convention  
held in Kiev on problems of physical metallurgy and methods of  
heat treatment of metals applied in the machine industry.  
The heat treatments of metals and alloys are discussed, and  
phase transformations in metals and alloys are determined by the effect of  
heat treatment on the quality of metal. The pos-  
sibility of obtaining metals with given mechanical properties  
is discussed, as are problems of steel brittleness. The col-  
lection includes papers dealing with kinetics of transformation,  
heat treatment, and properties of cast iron. No references, mostly  
are mentioned. Articles are accompanied by references, mostly  
are mentioned. Articles are accompanied by references, mostly

TITLE: Effect of misalignment of edges on the mechanical properties of the AMg6 alloy weld

SOURCE: Svarochnoye proizvodstvo, no. 1, 1967, 29-30

TOPIC TAGS: aluminum/magnesium alloy, <sup>alloy,</sup> <sup>welding,</sup> TIG welding, weld evaluation, mechanical property/AMg6 alloy

ABSTRACT: Specimens (250 x 120 mm) of AMg6 alloy sheets, 3mm thick, were TIG welded with different degrees of edge misalignment. It was found that with increasing degree of misalignment, the strength of welded joints decreases (see Fig. 1). As a rule, the specimens with a

$G_B$ , kg/mm<sup>2</sup>.

Fig. 1. Dependence of strength on degree of misalignment

Card 1/2

UDC: 621.791.052:699.715

ACC NRAP7007008

misalignment of up to 0.44 mm failed in the base metal at a stress of 32.8 kg/mm<sup>2</sup> and those with a misalignment over 0.44 mm failed in the fusion zone. The decrease in weld strength was caused mainly by unsatisfactory root formation. Therefore, several methods were tested to reduce the adverse affect of edge misalignment. None of the methods tested (increase of arc voltage or welding currents, increase of the rate of filler wire feed, or displacement of arc toward the higher edge) produced satisfactory results (weld strength equal to 90% of the base metal strength) when used alone. However, 2mm displacement of the arc toward the higher edge, an increase in the rate of filler wire feed to 3.4 cm/sec, and a slight increase in current yielded welds with a tensile strength of 29.8--32.2 kg/mm<sup>2</sup>. Orig. art. has: 4 figures and 2 tables.

2643. CLINICAL PROBLEMS IN CONNECTION WITH STRONGYLOIDIASIS  
(Russian text) - Kudryavtsev M.G. - NAUCH. RAB. I LEN. VOEN. -  
MORSK. GOSP. T957. (134-137)

Patients suffering from prolonged and stubborn diarrhoea are usually diagnosed as cases of chronic dysentery. In a few cases, however, the aetiology is different and cases of strongyloidiasis have been discovered. In the case described a variety of diagnoses were made during the last 8 yr., and only parasitological examination of fresh faecal smears enabled a *Strongyloides stercoralis* invasion to be diagnosed.
